QUICKBITE FOOD DELIVERY DATA ANALYTICS

1.Project Overview

This project studies QuickBite food delivery data. It looks at customers, restaurants, menu prices, orders, and payments. The goal was to find useful patterns and show them through charts.

2. Data Used

Five files were used: customers, restaurants, menu items, orders, and payments. The files were checked for missing values and duplicate rows. One missing customer segment was marked as 'unknown'. Six orders did not have delivery-time values. The tables were joined using their matching ID columns.

3. Customer Analysis

Bengaluru and Delhi had the most customers, with four each. Premium and Regular were the largest customer groups, with nine customers each. New customers numbered six, and one customer's segment was unknown.

4. Restaurant and Cuisine Analysis

Bengaluru, Delhi, Mumbai, and Kolkata each had three restaurants. Indian cuisine was the most common, with five restaurants. Restaurant ID 18 received the most orders, with seven.

5. Menu Price Analysis

There were 40 menu items. Prices ranged from 123.44 to 635.75, and the average menu price was about 379.36.

6. Order and Delivery Analysis

There were 50 orders: 38 Delivered, six Pending, and six Cancelled. The average order amount was about 956.79. The longest recorded delivery time was 70 minutes and the shortest was 24 minutes. Six orders had no delivery-time value.

7. Payment Analysis

Debit Card was the most common payment method, with 15 records. There were 43 Paid payments, four Pending, and three Failed. Debit Card also had the highest total order amount by payment method, at 16,046.67.

8. Customer and Restaurant Performance

Customer ID 18 had the highest total spending, at 5,033.76. Regular customers placed the most orders, with 24. Restaurant ID 18 had the highest revenue, at 6,362.45 from seven orders. Restaurant ID 10 followed with 5,675.32 from four orders.

9. Monthly Trends

June 2025 had the most orders, with 19, and the highest revenue, at 19,659.58. Order counts were lower in the following months. September had the lowest revenue among the months analyzed, at 8,380.37.

10. Main Findings

- Bengaluru and Delhi had the most customers.
- Premium and Regular were the largest customer groups.
- Indian cuisine was the most common cuisine.
- Restaurant ID 18 led in both order count and revenue.
- Most orders were delivered, but 12 were pending or cancelled.
- Most payments were successful, but seven were pending or failed.
- Regular customers placed the most orders.
- June was the strongest month in the data.
- Missing delivery-time values need to be checked.

11. Conclusion

The project used Python to study QuickBite customers, restaurants, menu items, orders, and payments. The analysis found the strongest customer groups, top restaurant, common payment method, and monthly order patterns. Overall, the results provide a clear picture of QuickBite's performance.
